Solution Requirements

Date	15 March 2026
Team ID	6ab2a81f009dcca3125ab2e5
Project Name	Student Enrollment & Course Management System (SECMS)
Maximum Marks	4 Marks

Team Members

S. No.	Team Member
1	M. Gayathiri
2	I. Geetha
3	S. Harini
4	I. Harini Sri
5	S. Hemavathi

Define Functional and Non-Functional Requirements

The following requirements define what the SECMS solution should do and the expected quality of operation, based on the project scope, user stories, Salesforce implementation plan, security needs, reporting and automation.

Step 1: Functional Requirements (FR)

S.No	Requirement Category	Requirement Description	Priority
1	Authentication	Users securely sign in to Salesforce and access the SECMS application according to their authenticated identity. Salesforce authentication is used for application access.	High
2	Authorization levels	Role-based access controls define permissions for Enrollment Officers, Administrators and Instructors. Users can access only the records and functions relevant to their responsibilities.	High
3	External interfaces	The core solution uses Salesforce services and internal Salesforce objects/automation. No third-party API or external database integration is specified in the project scope.	Medium
4	Transactions processing	The system captures student enrollment requests, validates them, routes approvals, records payment information, updates enrollment status and supports instructor assignment.	High
5	Reporting	Generate reports and dashboards for student enrollments, course/enrollment status, revenue/payment monitoring and operational performance. Reports support administrator decision-making.	High
6	Business rules, etc.	Apply validation rules and automated workflows to reduce duplicate/invalid entries; route enrollment approvals; prevent inappropriate processing; and automate instructor assignment based on course category.	High
7	Compliance to laws or regulations	Protect student and enrollment information using Salesforce security, role-based access and private record access. The provided project scope does not specify a named external regulation such as GDPR or HIPAA.	High
8	Other	Maintain centralized Student, Course, Enrollment, Instructor and payment-related records; provide Lightning UI, page layouts, tabs and automated flows for efficient enrollment processing.	High

Solution Requirements – Functional Requirements

Functional Requirements (continued)

The completed FR table above covers authentication, authorization, interfaces, transactions, reporting, business rules, compliance/security expectations and other core SECMS functions.

Functional Requirement Summary

Area	SECMS Function
Student Management	Create and manage centralized student records and maintain accurate student information.
Course Management	Create and manage course records, course categories and course-related information.
Enrollment Processing	Submit, validate, approve and update student enrollment requests.
Instructor Assignment	Assign instructors to approved enrollments based on course category and availability/process rules.
Payment / Revenue	Record payment-related enrollment information and support revenue monitoring.
Automation	Use Salesforce Flows, Validation Rules and Approval Process automation to reduce manual work and errors.
Reporting & Dashboards	Provide enrollment, payment/revenue and operational reports and dashboards.
Security	Use Salesforce role-based access and private enrollment access to protect records.

Step 2: Non-Functional Requirements (NFR)

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria
1	Performance & Speed	The Salesforce application should provide responsive page navigation, record retrieval, validation, approval and dashboard operations.	Normal user actions should complete within an acceptable Salesforce response time; no unnecessary manual processing bottlenecks.
2	Scalability	The solution should support growth in student, course, enrollment, instructor and payment records using Salesforce objects and scalable automation.	System continues to support increasing records/users without redesign of the core data model; automation remains manageable.
3	Security & Data Privacy	Student and enrollment data should be protected through authenticated access, role-based permissions, private record access and Salesforce security controls.	Unauthorized users cannot access restricted records; users see only permitted data and functions.
4	Reliability & Availability	Enrollment, approval, validation, reporting and data-management processes should operate reliably on the Salesforce platform.	Core workflows execute consistently; validation and approval rules prevent invalid processing and data errors.
5	Usability & Accessibility	Provide a clear Salesforce Lightning UI with appropriate tabs, page layouts, dashboards and simplified automated workflows.	Enrollment users can complete common tasks with minimal manual follow-up and can easily view required records/reports.
6	Other	Maintainability and consistency should be supported through Salesforce objects, reusable Flows, validation rules, approval processes, reports and dashboards.	Configuration is organized and testable; changes to business rules can be maintained without rebuilding the complete application.

Note: Where the original project material does not specify a numerical acceptance target (for example, exact seconds or uptime percentage), the acceptance criteria above are expressed as project-specific qualitative criteria rather than invented numeric values.
